Multivariate Data Analysis

INTRODUCTION

Multivariate statistics involves observation and analysis of more than one statistical outcome variable at a time. In design and analysis, the technique is used to perform studies across multiple dimensions while taking into account the effects of all variables on the responses of interest. Researchers use multivariate procedures when they are interested in studying more than one outcome simultaneously (also known as the dependent or phenomenon of interest), more than one impacting variable (also known as an independent or predictor), or both. This type of analysis is desirable because researchers often hypothesize that a given outcome of interest is influenced by more than one variable. There are many statistical techniques for conducting multivariate analysis, and the most appropriate technique for a given study varies with the type of study and the key research questions.

OBJECTIVE

The purpose of this FDP is to provide faculty and research scholars with the tools to gain a better understanding of the available techniques for data analysis with a focus on multivariate techniques. This program also aims to provide hands-on training on SPSS, AMOS software for analyzing the data and interpreting outcomes of various analyses.

CONTENTS

- Multiple regression
- MANOVA
- Logistic regression
- Discriminant Analysis
- Factor Analysis
- Cluster Analysis
- SEM using AMOS

METHODOLOGY

Typically, participants will get 75% input in lab session and 25% input through class discussion.

WHO SHOULD ATTEND

All those who deal with data analysis will benefit most from this program and so, this program will be useful to:
