Abstract

The eGovernment is being adopted by any government all across the world for better facilitation of public services. In a citizen-centric service i.e. of, by and for the citizens, however the developing countries like China, India and Brazil are finding it tough to convince their masses to try, avail and trust these eGovernment facilities. Actually the success of any eGovernance program can be measured by the reach of different computer (ICT) based services at the grass root level. The present research analysis of Chinese eGovernment program focus on sector specific like the core, low cost manufacture and few governments on-line programs (GOP) impacting China's economic growth. The increased government provided services through eGovernment programme in these areas will not only bring down the cost but also increase transparency, autonomy and global economic integration.

Key Words: E-Government, Citizen-Centric, FDI, GOP, ICT
